- ✓ It's used to define a language.
- ✓ It's a graphical Method.

Contains any no of a's

Contains a or b

Starts with a and contains any number of b's in end

Contains any number of **a's** or **b's**

Stars with **a**

$$R = a(a+b)^*$$

Deterministic Finite Automata - What is DFA and how to draw DFA?

Definition:

- ✓ It's a type of Finite Automata that used to define languages **in which next state is already known**
- ✓ It consists of following 5 Parts;

FA: $\{Q, Q_0, F, \Sigma, \delta\}$

Q: Number of States

Q_0 : Initial State

F: Final State

Σ : Letters in Alphabet

δ : Transitions / Movements

How to draw Deterministic finite automata

DFA for a language that starts with **aa**

- Circle/Ovals for Initial State, Normal State and Final State
- Arrow for Transition with letters above
- Loop and OR
- Only one output; single letter can not go to multiple state from one state

What is it named as Deterministic Finite Automata?

Automata: Plural of Automaton (i.e. automatic, self controlled machine)

Finite: Finite number of states / letters/ transitions

Deterministic: Output is already known (has only one next state)
